

ABSTRACT OF THE DISCLOSURE

As the number of pixels in a digital camera is increased, the power consumption is increased due to an increased quantity of data to be photographed, which inevitably requires a large capacity of battery and an increased camera weight. In order to enhance a picture quality, an optical system is also required to have a larger scale, with the result that the casing of the camera becomes large. In facilities such as an amusement part, since the user carries the camera for a long time, the heavy, large-sized camera becomes cumbersome to deal with. The camera is installed at a photographing spot in the facilities, the camera is provided with a means for performing wireless communication with a portable device carried by the user, and photographed image data is saved in a recording medium of the portable device or in a server connected between the camera and a network.
